

Joint Annual R&D Workshop and 6th Momentum
Partnership Convective Scale Workshop
9-13 September 2024

Modelling of Extreme Rainfall in Singapore Using 100 m uSINGV

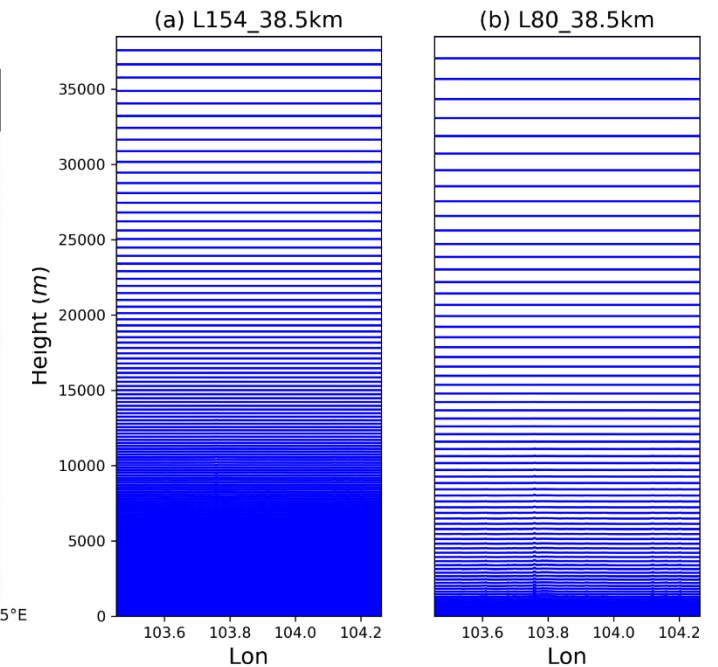

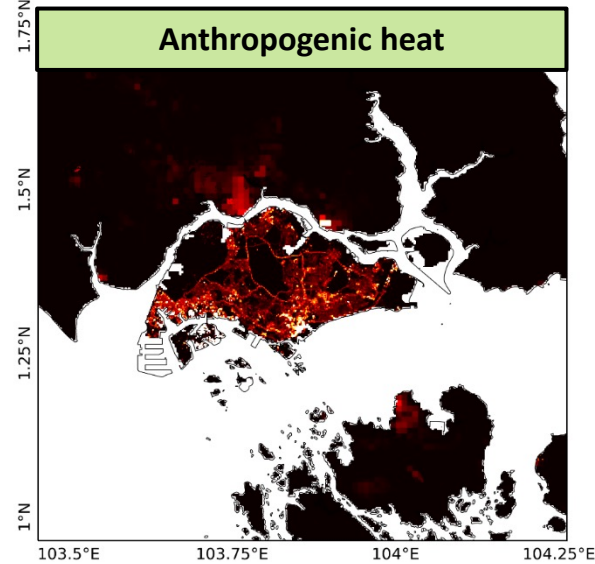

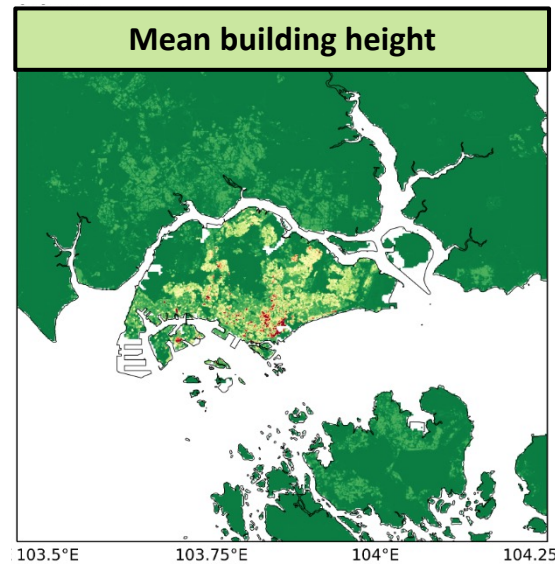

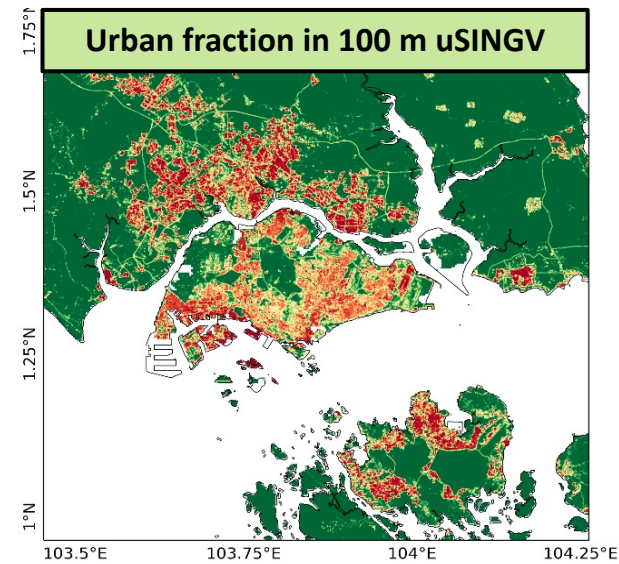

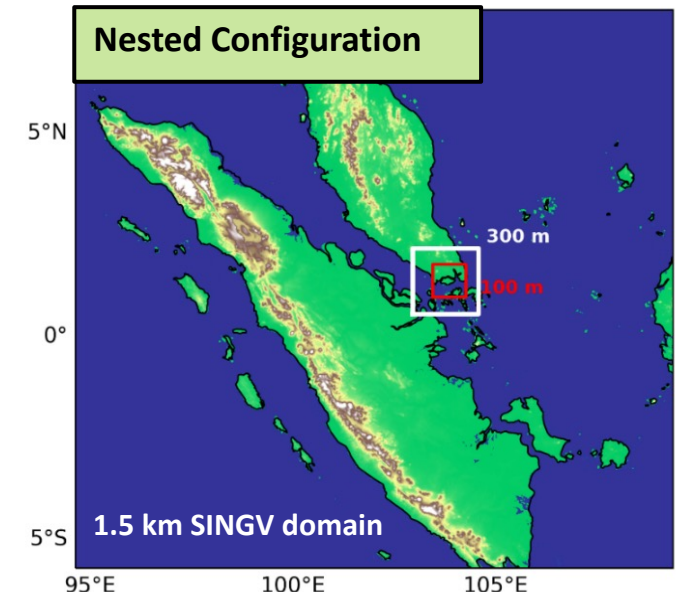

Utkarsh Bhautmage², Song Chen¹, Matthias Roth², Pratiman Patel¹,
Kalli Furtado¹, and Hugh Zhang¹

1 Centre for Climate Research Singapore, Meteorological Service Singapore

2 Department of Geography, National University Singapore

About 100 m uSINGV

- From 1.5 km SINGV → 300 m uSINGV → **100 m uSINGV**
 - Increased model grid resolution
 - Improved urban ancillaries
 - Land cover, urban morphology, anthropogenic heat
 - Option of a new hi-res vertical grid resolution: L154_38.5km
 - Upgraded to RAL3

Extreme rainfalls in Singapore

- Mainly from Sumatra squalls and localized thunderstorms
 - Localized thunderstorms
 - Short-lived and small scale, can be high intensity → difficult to capture in models
 - Convergence due to strong solar heating
 - Heavy rainfall definition in SG: *> 70mm/60min or 35mm/30min, minimum duration of 15mins*
- Can 100 m uSINGV capture/represent extreme rainfalls in Singapore?

Research Collaboration Agreement (RCA) Project between CCRS and NUS

- “Evaluation and development of 100 m uSINGV for extreme rainfall and wind modelling in Singapore”
- Two-year project: August 2023 – July 2025
- Team
 - NUS: Utkarsh Bhautmage and Matthias Roth
 - CCRS: Song Chen, Hugh Zhang, Kalli Furtado, and Pratiman Patel

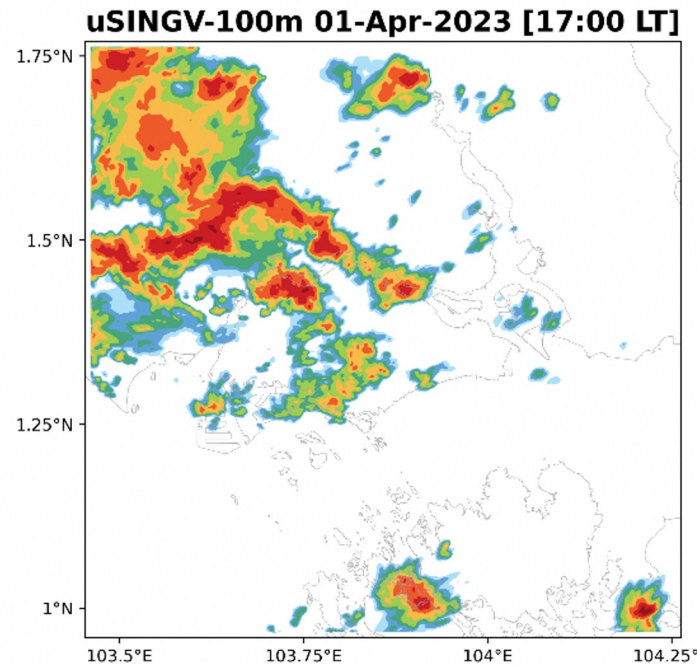

Improvements on rainfall from RAL3 physics in 100 m uSINGV with MORUSES

RAL2

RAL3

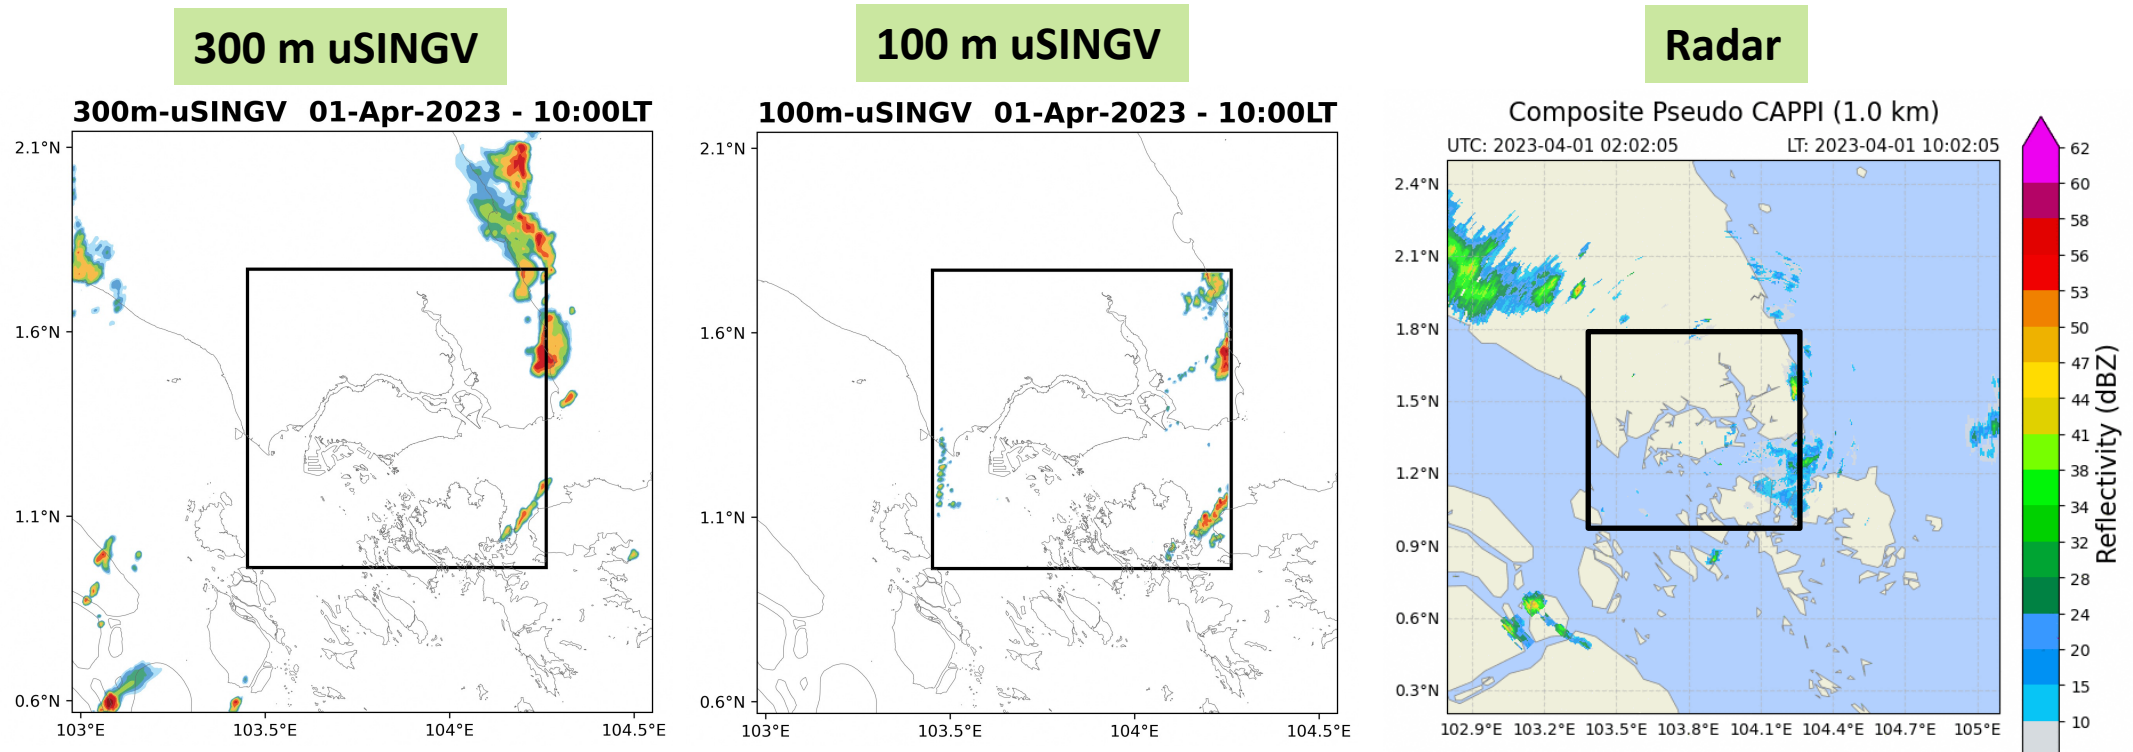

Radar

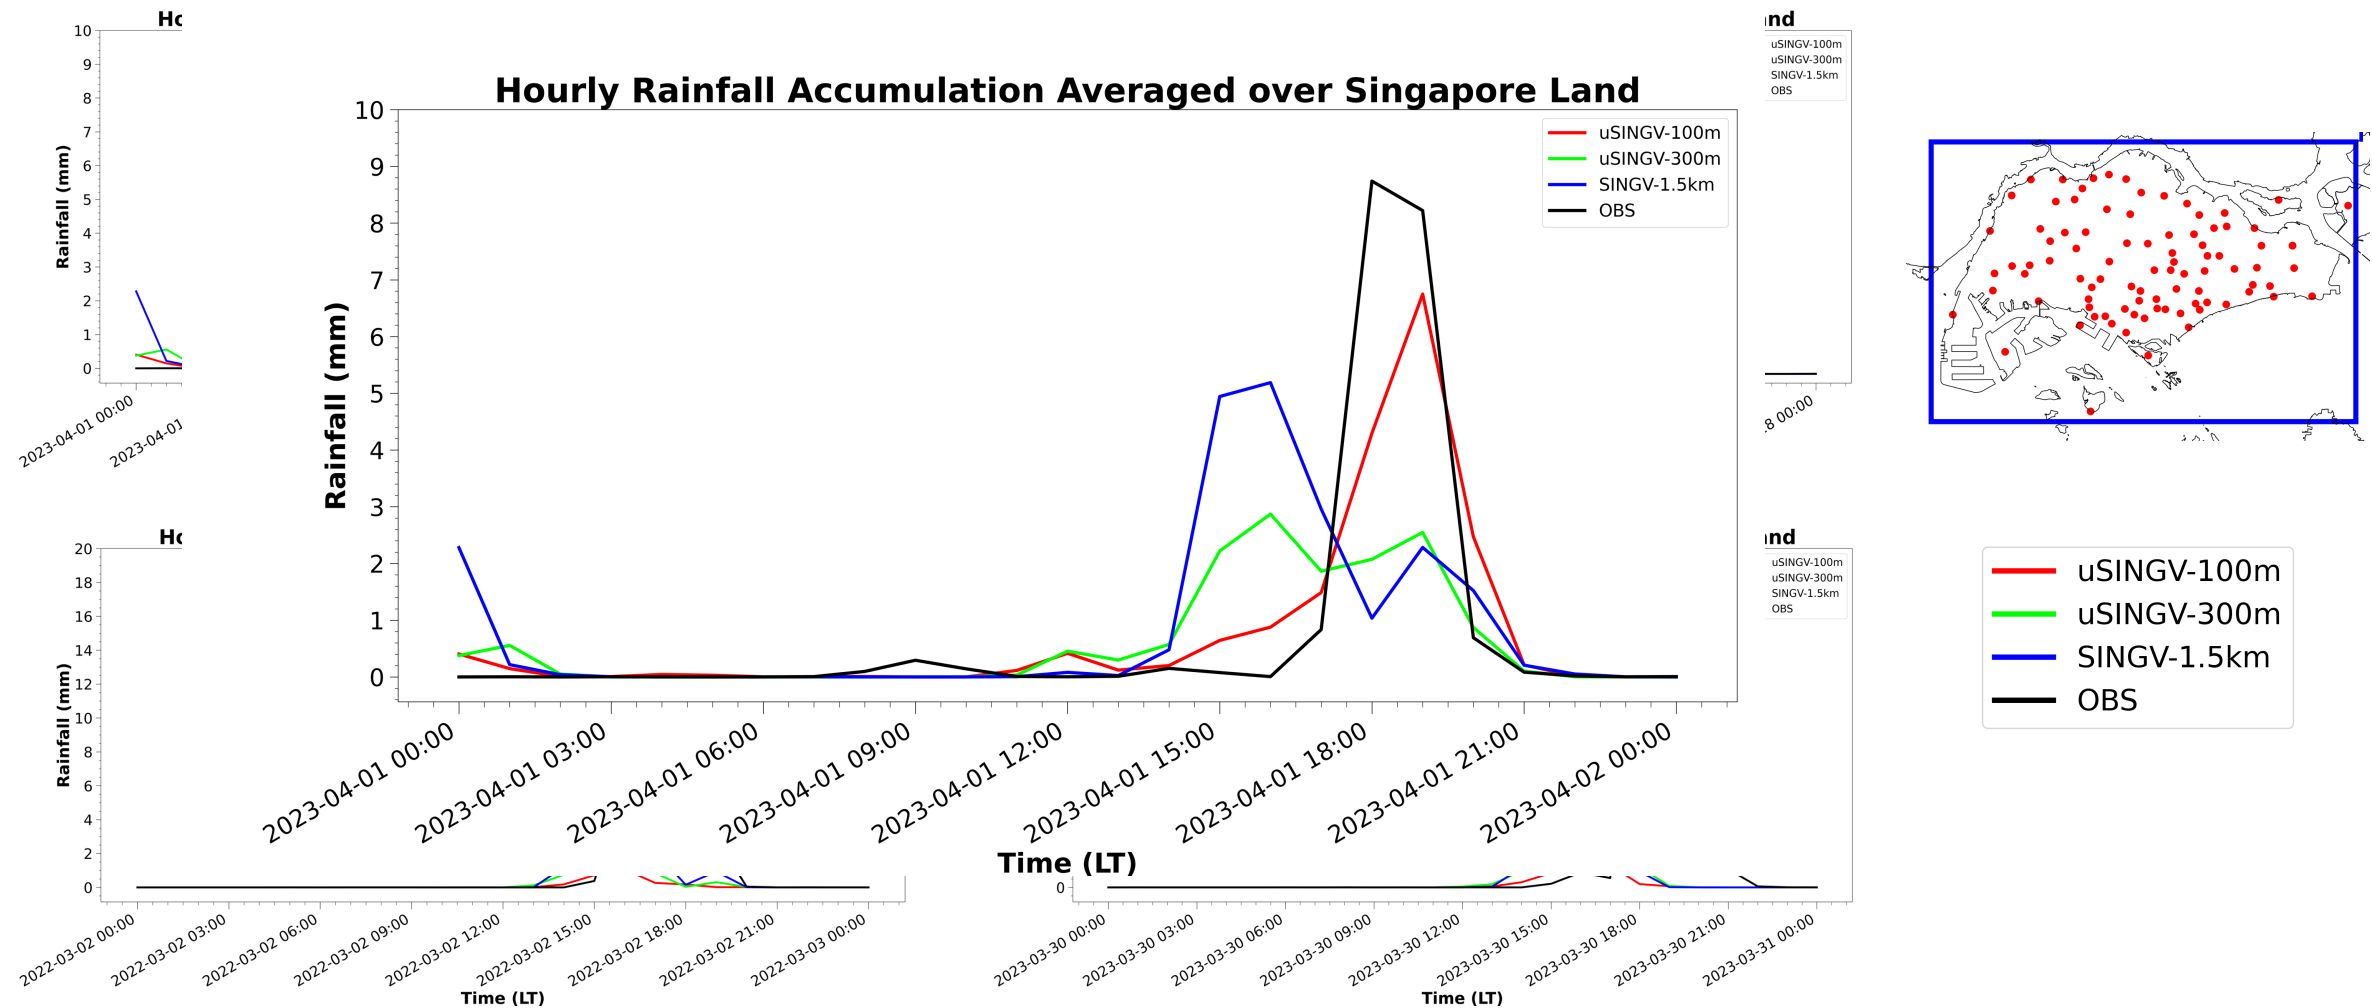

Convergence induced heavy rainfalls

- ~30 selected cases have been run : *> 70mm/60min or 35mm/30min, minimum duration of 15mins*
- From 1.5km SINGV → 300 m uSINGV (MORUSES) → 100 m uSINGV (MORUSES)
- Example: heavy rainfall at 16:00 -21:00 local time 1st April 2023

Time series of hourly rainfall averaged over land

Comparison with stations

Maximum hourly rainfall accumulation

Comparison with stations

case	EXTREME RAINFALL CRITERIA [based on stn.]	Maximum Hourly Rainfall Accumulation (mm) [Station]	Maximum Hourly Rainfall Accumulation (mm) [Model]		Maximum Half Hourly Rainfall Accumulation (mm) [Station]	Maximum Half Hourly Rainfall Accumulation (mm) [Model]	
		Magnitude	300m-uSINGV	100m-uSINGV	Magnitude	300m-uSINGV	100m-uSINGV
1	≥ 70 mm/h	98.49	56.18	71.85	53.86	46.75	30.09
2	≥ 70 mm/h	84.85	94.86	45.88	70.24	78.53	37.6
3	≥ 70 mm/h	90.45	59.21	35.94	59.09	48.9	35.28
4	≥ 70 mm/h	78.4	68.6	94.05	63.4	54.13	72.35
5	≥ 70 mm/h	99.35	78.61	69.49	57.4	56.35	48.68
6	≥ 35 mm/30 min	51.6	65.69	45.41	35.8	49.57	40.58
7	≥ 35 mm/30 min	32.4	57.54	39.62	30.6	57.37	33.12
8	≥ 35 mm/30 min	45.2	64.9	92.4	43.05	57.83	62.81
9	≥ 35 mm/30 min	41.78	49.9	45.71	41.78	47.1	42.11
10	≥ 35 mm/30 min	33	47.81	37.44	33	37.02	33.22

■ → Under Threshold

■ → Above Threshold

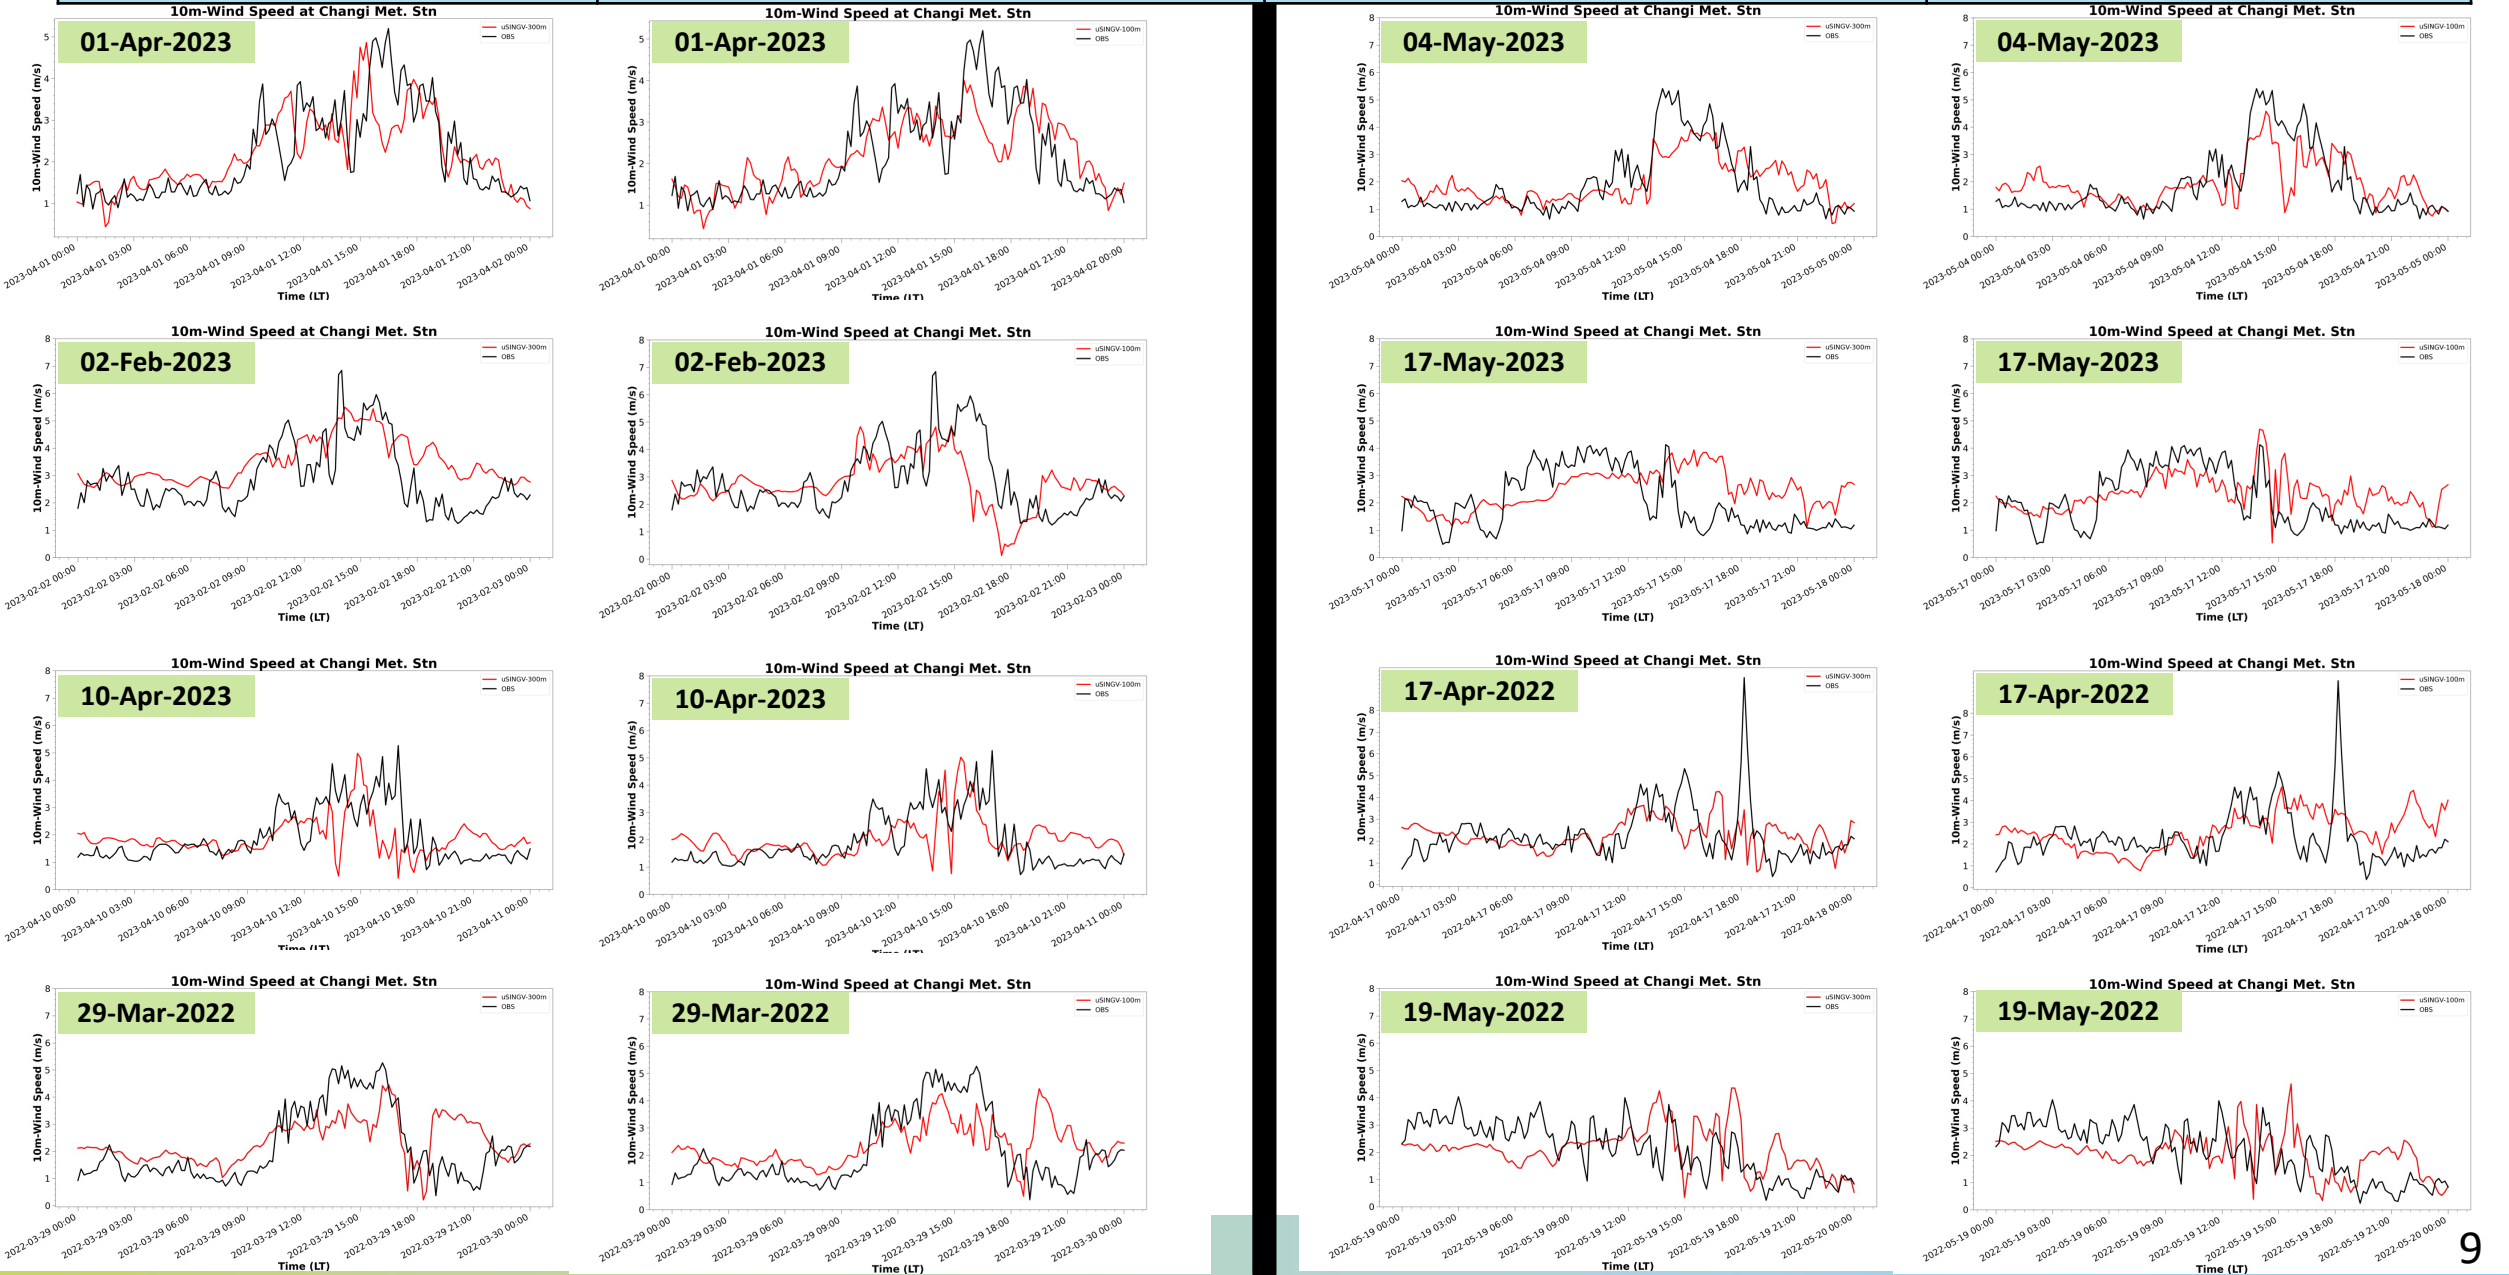

■ → Maximum Value Cell

Extreme rainfall event: ≥ 70 mm/h or ≥ 35 mm/30 min

10m-Wind Speed Time-Series Plots Comparison at Changi

Impacts of urban - a case study

- Urban vs no-urban (replacing urban areas with broadleaf trees)

Remarks

- This project focuses on evaluation of 100 m uSINGV on extreme rainfalls in SG.
- RAL3 improvements are observed in 100 m uSINGV too
- Evaluations on the convergence induced heavy rainfall **timing**, **pattern**, and **intensity** and **near-surface wind fields** are on-going for 100 m uSINGV (further analysis needed)
- Strong urban impacts on the localized thunderstorms in 100 m uSINGV (more analysis to follow)
