

Water Reporting Summary – Intersecting Streams Catchment

15 April 2021

Overview

- In the last month, there has been widespread rainfall across the Intersecting Streams catchment with upstream areas receiving 100 to 200 mm of rainfall. Downstream areas south of Yappalee received 25 to 100 mm (Figure 1). The total area-average rainfall for the catchment was 80 mm, with more than half of this rainfall received in the third week of March. This rainfall in the last month is in the context of the extended dry period since January 2017 with rainfall across the Intersecting Streams catchment mainly below average with some areas near Lightning Ridge, Wapweelah, White Cliffs and Baden Park being very much below average (Figure 2).
- The rainfall over the last month has resulted in above average to very much above average root zone soil moisture conditions across the Intersecting Streams catchment. Recent rainfall has translated into significant runoff and flows in the Narran and Warrego Rivers (Figure 3).
- Water resources are shared between water users according to a water sharing plan, with entitlements on issue shown in Table 1. However, the ability of water users to take water is governed by entitlement conditions which are subject to river flow conditions. For the 2020–21 water year, there has been no water trading activity to date (Table 2).

Recent conditions

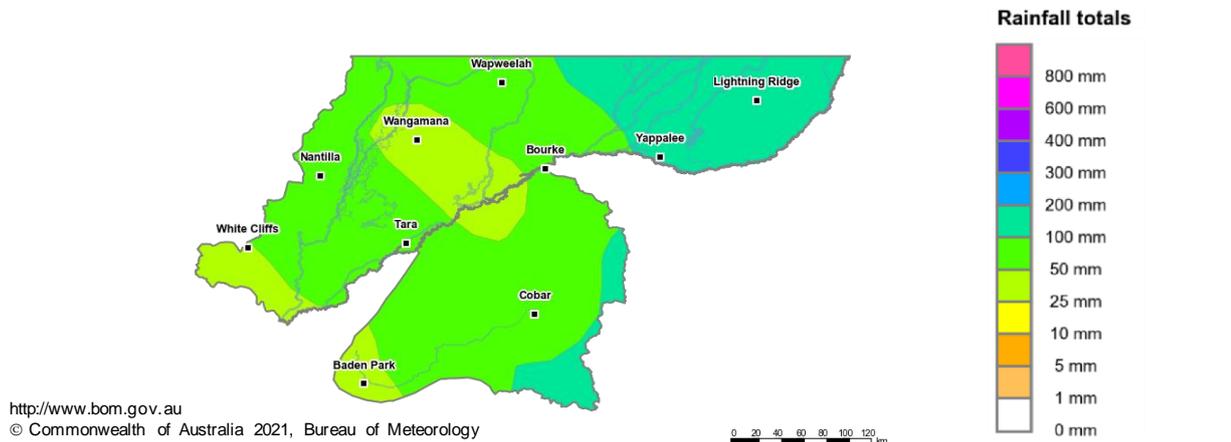

Figure 1: Rainfall totals for the last 30 days (17 March to 15 April 2021)

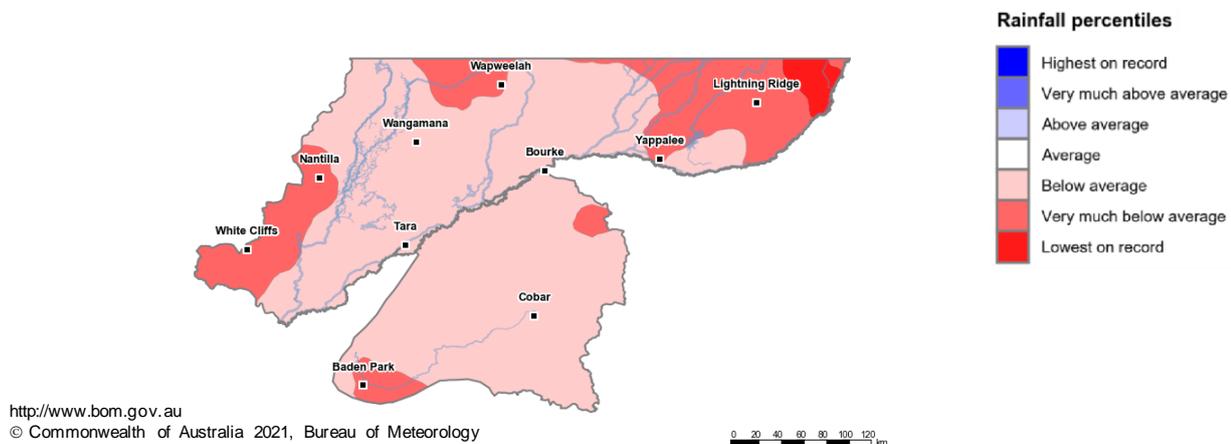

Figure 2: Rainfall percentiles since January 2017 (compared to 1900–2019 long-term average) (Jan 2017 to March 2021)

Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

How much water is in the river at selected gauges?

Warrego River at Boera Dam

Narran River at Angledool No.2

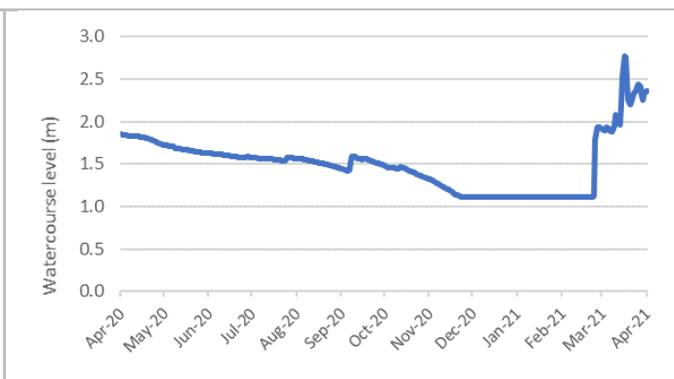

Figure 3: Water course levels for last 12 months at selected gauges in the Intersecting Streams catchment (as at 15 April 2021)

Who is the water for?

As the Intersecting Streams catchment is an unregulated system, water is not stored for the purpose of supplying orders to downstream users. Water is shared between different users according to the *Water Sharing Plan for the Intersecting Streams Unregulated and Alluvial Water Sources 2011* (NSW DPIE). The plan includes categories of water licences or entitlements and the share of the water resource for each entitlement category (expressed as a nominal volume). Entitlements on issue as at 1 July 2020 are shown in Table 1. This does not necessarily represent water that is actually available to licence holders at a given point in time as each licence category has conditions that govern when water can be taken.

Table 1: Nominal volumes of water entitlements on issue, per licence categories (GL) for the 2020–21 water year (last updated 1 July 2020)

Entitlement category	Entitlement share (Nominal GL)
Domestic & Stock	0.48
Unregulated River – Consumptive	17.4
Unregulated River – Environmental	17.8
