

Water Reporting Summary - Victorian Murray Catchment

15 September 2020

Overview

- In the past month, most of the central and lower Victorian Murray catchment received 10 to 25 mm of rainfall, while some alpine areas of the upper Victorian Murray around Hume and Dartmouth Dams received up to 100 mm of rain (Figure 1). The area-average rainfall for the catchment was 49 mm. However, this recent patchy rainfall is in the context of the extended dry period since January 2017 with rainfall across the Victorian Murray catchment mostly below average or very much below average (Figure 2).
- Soil moisture remains average across most of the catchment and below average near Hume Dam, however, as this is typically a wet time of year for this area, the average is relatively high. Recent rainfall has translated into some runoff and inflows into storages (Figures 3 and 4).
- Announced allocations for high reliability water shares are currently 36%, similar to this time last year. Allocation prices are currently \$180-\$240 per ML, which is lower than prices paid last month (\$240-\$350 per ML) and significantly lower than the peak of over \$900 per ML in November 2019 (Table 1).
- Looking forward to the 2020-21 summer, if storages experience average inflows similar to those received during 2017-18, announced allocations are expected to reach 100% for high-reliability water shares by February 2021 (Northern Victoria Resource Manager).

Recent conditions

Rainfall totals

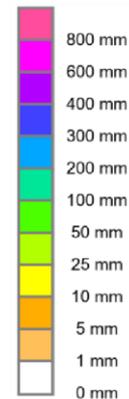

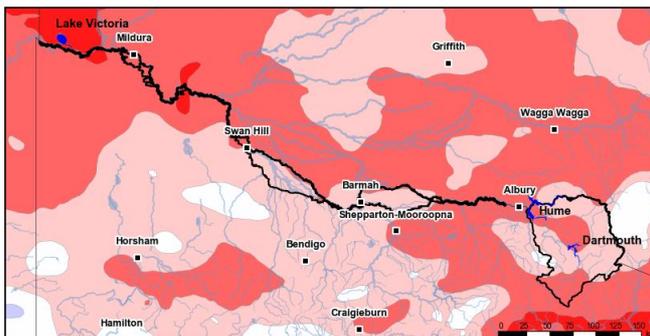

Figure 1: Rainfall totals for the last 30 days (17 Aug to 15 Sept 2020)

Rainfall percentiles

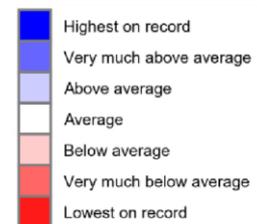

Figure 2: Rainfall percentiles since January 2017 (Compared to 1900-2019 long-term average) (Jan 2017 to Aug 2020)
Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

How much water is in the storages?

Combined total storage (Vic share*): 2,212 GL (as at end Aug 2020)

*Victoria's share of Dartmouth, Hume, Lake Victoria and Menindee Lakes storages

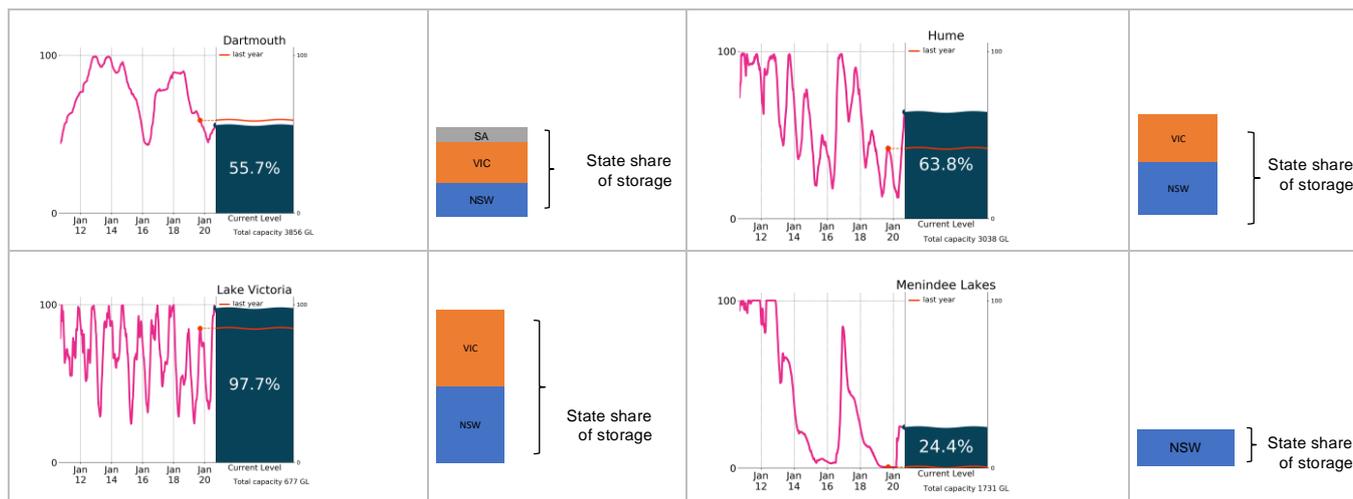

Figure 3: Current total storage (% of total capacity) as at 15 September 2020 compared to the last ten years (State shares updated end Aug 2020)

NB: Allocation information shows water available in allocation accounts and remaining commitments as at 15 September 2020. Information published by the Northern Victoria Resource Manager differs from information published on the Victorian Water Register as the former includes preliminary environmental water holder use and volumes of operational use by Goulburn-Murray Water private water shareholders.

Table 1: Allocation announcements (%) and market prices – Selected licence categories as at 15 September 2020

Licence category	Announced allocation	Historic comparison (same time of year)	Entitlement Prices (monthly median)	Allocation Price (median - last 7 days)
Vic Murray High-Reliability Water Share	36%	33% last year	\$4,300/ML (Zone 6) \$6,000/ML (Zone 7)	\$180/ML (Zone 6) \$240/ML (Zone 7)
Vic Murray Low-Reliability Water Share	0%	Same as most years	\$550/ML (Zone 6) \$693/ML (Zone 7)	

Zone 6: Upper Victorian Murray (Dartmouth to Barmah); Zone 7 is lower Victorian Murray (Barmah to SA border)
