

Water Reporting Summary – Wimmera–Mallee Catchment

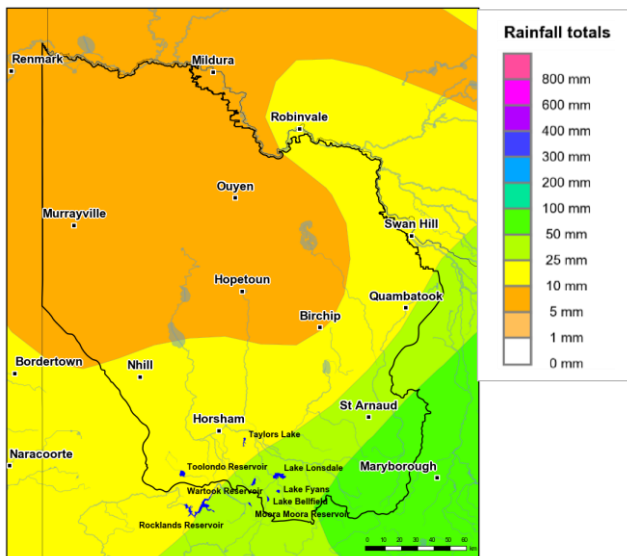

1 April 2021

Overview

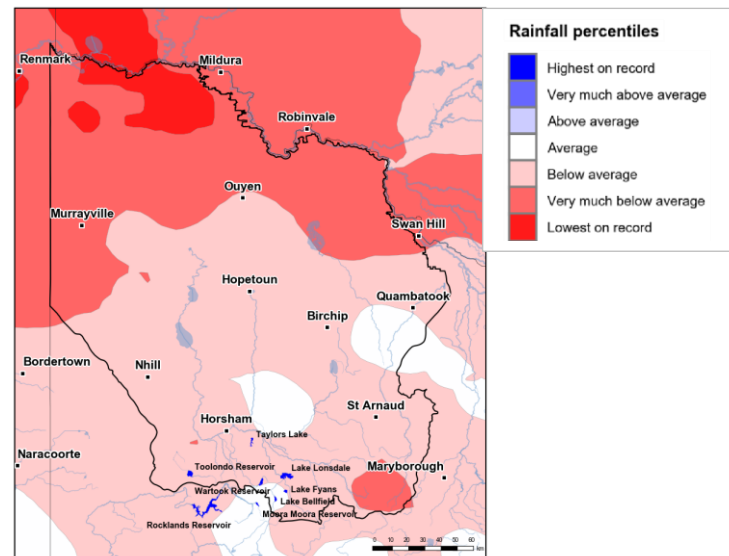

- Despite the widespread rainfall recorded across the Murray-Darling Basin in the last month, most of the Wimmera–Mallee catchment only received less than 25 mm of rainfall, with areas around Murrayville, Hopetoun and Ouyen receiving less than 10 mm. Moving south-east, rainfall increased with areas around the reservoirs and the lakes receiving 25 to 100 mm (Figure 1). The total area-average rainfall for the catchment was 15 mm. This recent rainfall is in the context of the extended dry period since January 2017 with rainfall for the central and upper Wimmera–Mallee catchment mainly being below average, and downstream areas being mainly very much below average (Figure 2).
- The rainfall in the last month has resulted in average to below average root zone soil moisture for the Wimmera–Mallee catchment; it has not translated into significant runoff and inflows into storages (Figure 3). Allocations for Wimmera–Mallee Pipeline Product entitlement holders are currently 56% (Figure 4 and Table 1) (GMMWater Storage Manager).

Figure 2: Rainfall percentiles since January 2017 (compared to 1900–2019 long-term average) (Jan 2017 to Mar 2021)

Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

How much water is in the storages?

Storage volume: Lake Bellfield, Lake Fyans, Lake Lonsdale, Moora, Rocklands, Taylors Lake, Toolondo and Wartook storages as at 23 March 2021

Figure 3: Current total storage (% of total capacity) compared to the last ten years
