

Water Reporting Summary – Condamine–Balonne Catchment

1 March 2021

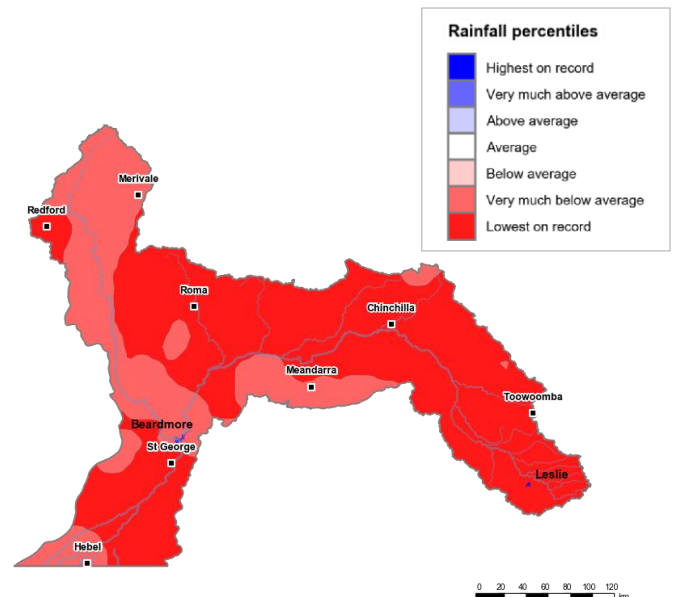

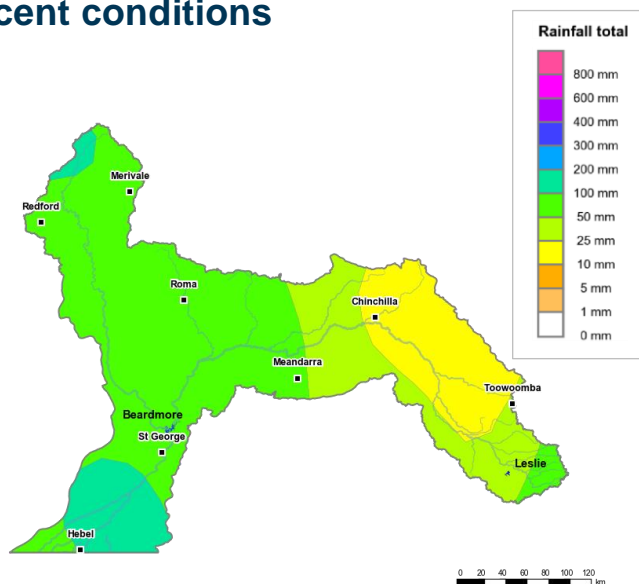

Photo: Beardmore Dam – Balonne Shire Council

Overview

- In the last month, the central and north-western areas of the Condamine–Balonne catchment received 50 to 100 mm of rainfall, with some downstream areas near Hebel receiving up to 200 mm. Most of the upper Condamine–Balonne catchment received 10 to 50 mm of rainfall (Figure 1). As a result, the total area-average rainfall across the catchment was 63 mm over the last 30 days. This rainfall is in the context of the extended dry period since January 2017 with rainfall across the Condamine–Balonne catchment mainly very much below average or lowest on record (Figure 2).
- In the last 30 days, root zone soil moisture was mostly average in the central areas of the Condamine–Balonne catchment, and above average near Meandarra. Below average soil moisture occurred near Chinchilla, Redford and Merivale. Recent rainfall has translated into some runoff and inflows into storages (Figure 3).
- Announced allocations for high priority entitlements in water supply schemes (WSS) in the Condamine–Balonne catchment opened the 2020–21 water year at 100%. Allocations for medium priority entitlements in the St George WSS have increased from 39% to 75%, which is 16% lower than the same time last year. Relatively low storage levels in the Chinchilla and Leslie storages have resulted in medium priority allocations for the Upper Condamine WSS and Chinchilla Weir WSS both currently being 0%, which has occurred three times in the last ten years (Figure 4 and Table 1).

Figure 2: Rainfall percentiles since January 2017 (compared to 1900–2019 long-term average) (Jan 2017 to Feb 2021)

Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

How much water is in the storages?

Storage volume: Beardmore, Leslie, Chinchilla and Jack Taylor storages as at 1 March 2021

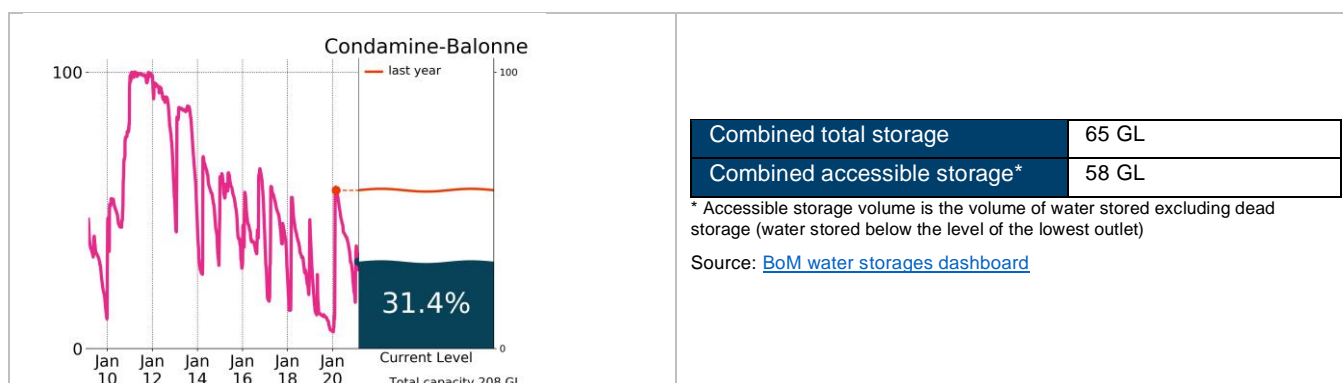

Figure 3: Current total storage (% of total capacity) compared to the last ten years

Who is the water in storages for?

Figure 4: Volumes of water allocated (% of total) for the 2020–21 water year, supplemented schemes (last updated 1 March 2021)

Environmental allocations represent water allocations held by the CEWO only as at December 2020 and do not include environmental pass flow requirements in the operation of infrastructure throughout the catchment.

NB: Allocation information shown here is water allocated in supplemented schemes for various purposes as at 1 March 2021. It does not include unsupplemented entitlements. The information also does not represent remaining available allocated water as it does not allow for water used, traded or new storage inflows (in excess of minimum assumptions).

Table 1: Allocation announcements (%) – selected licence categories (last updated 1 July 2020)

Licence category	Announced allocation	Historic comparison (same time of year)
St George WSS Medium Priority (Bulk Share)*	75%	16% lower than same time last year
Upper Condamine WSS High Priority A & B	100%	Same as most years
Upper Condamine WSS Medium Priority	0%	Opening allocation of 0% has occurred three times in the last ten years
Chinchilla Weir WSS High Priority	100%	Same as most years
Chinchilla Weir WSS Medium Priority	0%	Opening allocation of 0% has occurred three times in the last ten years

* Announced Allocation applies to Bulk Share accounts only. The majority of water allocations are managed on a continuous accounting basis (capacity share)
