

Water Reporting Summary – Wimmera–Mallee Catchment

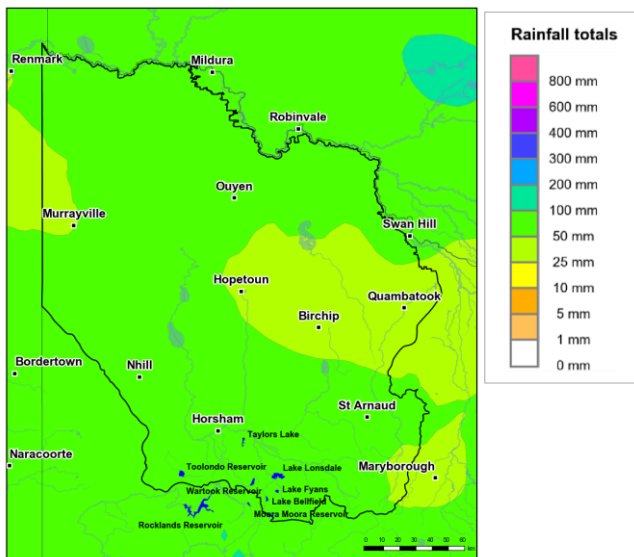

2 November 2020

Overview

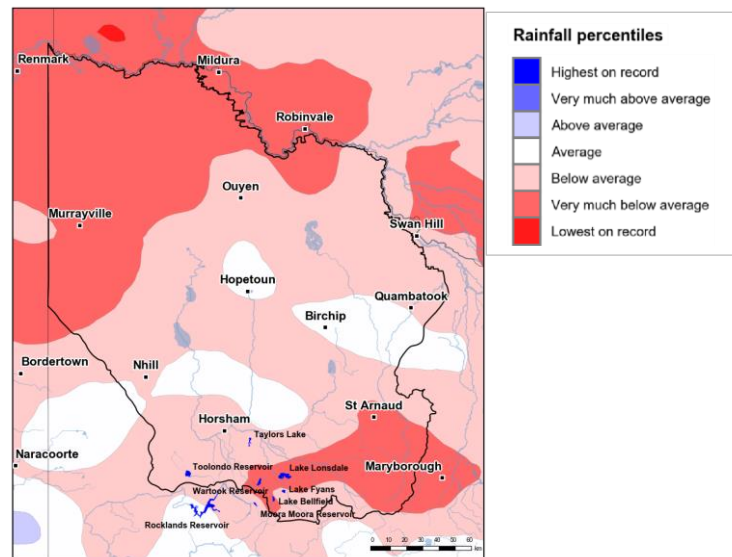

- In the last month, there has been widespread rainfall across the Wimmera–Mallee catchment. Most of the catchment received 50 to 100 mm, with the exception of central areas near Birchip and Quambatook, and west of Murrayville, which received 25 to 50 mm of rainfall (Figure 1). The total area-average rainfall for the catchment was 58 mm. This recent rainfall is in the context of the extended dry period since January 2017 with rainfall for the central Wimmera–Mallee catchment being average or below average, and the remainder of the catchment being mainly very much below average (Figure 2).
- Rainfall in the last month has resulted in average root zone soil moisture for the southern and eastern areas of the Wimmera–Mallee catchment, and above average soil moisture for northwest areas of the catchment. Recent rainfall near storages has translated into some runoff and inflows into storages (Figure 3). Allocations remain the same as last fortnight (Figure 4), with Wimmera–Mallee Pipeline Product entitlement holders receiving 21% allocations (Table 1) (GWMWater Storage Manager).

Figure 2: Rainfall percentiles since January 2017 (compared to 1900–2019 long-term average) (Jan 2017 to Oct 2020)

Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

How much water is in the storages?

Storage volume: Lake Bellfield, Lake Fyans, Lake Lonsdale, Moora, Rocklands, Taylor Lake, Toolondo and Wartook storages as at 2 November 2020
