

# Water Reporting Summary - Goulburn Catchment

17 February 2020

Photo: Goulburn River August 2018 by Nils Versemann

## Overview

- In the last month, the Goulburn catchment has received much-needed rainfall. Over the last 30 day period, most of the catchment received 50 to 100 mm, with large parts of the upper catchment receiving up to 200 mm (Figure 1). The area-average rainfall for the catchment was 83 mm. However, this recent rainfall is in the context of the extended dry period since January 2017 with rainfall across the Goulburn catchment being below average to very much below average (Figure 2).
- The recent rainfall has done little to improve storage volumes and inflows, resulting in relatively low current allocation volumes (Figure 3). Looking forward to the 2020-21 summer, if storages receive similar inflows to those received during 2019-20, announced allocations (known as seasonal determinations) would only be expected to reach 60% for high-reliability water shares (Northern Victoria Resource Manager).
- Announced allocations for high-reliability water shares are currently 71%, which is the lowest level for this time of year since 2009-10 (Table 1).

## Recent conditions

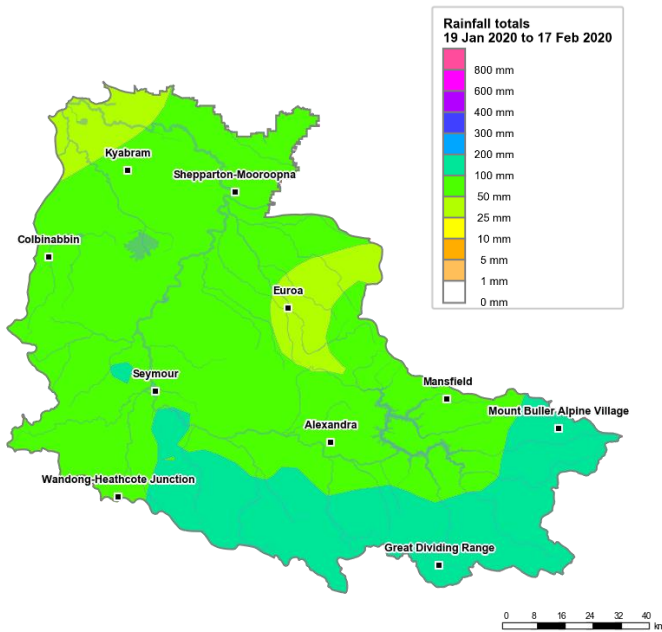

Figure 1: Rainfall totals for the last 30 days

Figure 2: Rainfall percentiles since January 2017  
(Compared to 1900-2019 long-term average)

Note: Rainfall percentiles for the period from January 2017 are shown as the Bureau of Meteorology considers January 2017 to be the start of the current dry period for eastern Australia.

## How much water is in the storages (as at 17 February 2020)?

Storage volume: Eildon and Waranga basin storages

<b>Combined total storage</b>	1,529 GL
<b>Combined accessible storage*</b>	1,318 GL
<b>%Full (total storage capacity)</b>	41%
<b>%Full (same time last year)</b>	46%

\*Accessible storage volume is the volume of water stored excluding dead storage (water stored below the level of the lowest outlet)

## Who is the water for?

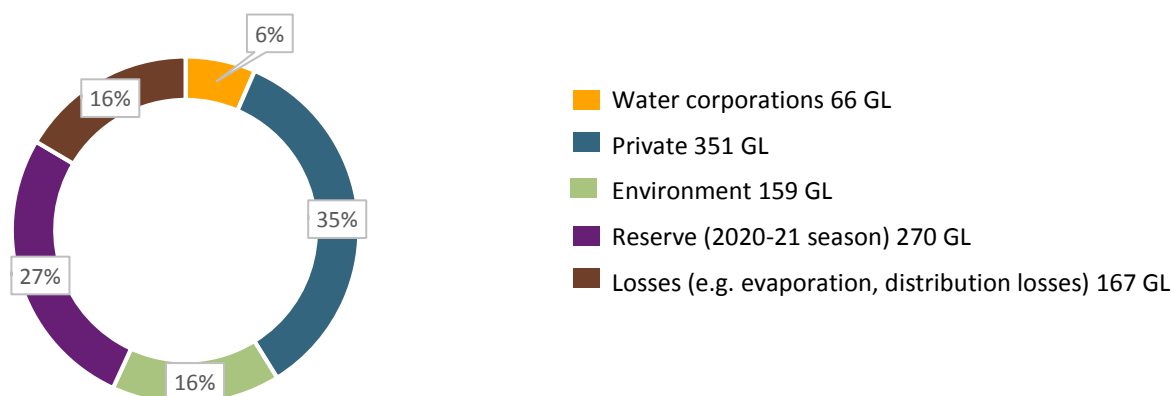

Figure 3: Volumes of water allocations currently available or remaining (% of total remaining) (as at 17 February 2020)

Source: [Northern Victoria Resource Manager](#)

NB: Allocation information shows water currently available in allocation accounts and remaining commitments. Information published by the Northern Victoria Resource Manager differs from information published on the Victorian Water Register as the former includes preliminary environmental water holder use and volumes of operational use by Goulburn-Murray Water private water shareholders.

Table 1: Allocation announcements (seasonal determinations) (%) - Selected licence categories as at 17 February 2020

Licence category	Current announced allocation	Historic comparison (same time of year)
VIC Goulburn High-Reliability Water Share	71%	Lowest since 2009-10
VIC Goulburn Low-Reliability Water Share	0%	Same as most years
