The Australian Baseline Sea Level Monitoring Project

Monthly Data Report

SEPTEMBER 2006

INTRODUCTION

The mission of the project is to monitor changes in sea level around Australia. It involves the operation and maintenance of an array of high-resolution sea level gauges and associated meteorological instruments (see Figure B) and management of a quality controlled national database of observations that is made available to the scientific and wider communities.

The Baseline array and a similar array in the South Pacific have been widely acknowledged in the global science community as two of the most accurate and reliable sources for information on sea level and climate change anywhere in the world.

This report is one of a series of monthly data reports that provide tables and figures summarising the data collected to date. The accompanying text relates primarily to the quality of the data rather than its interpretation. Periodic scientific evaluation of the data in the context of climate variability and climate change is provided in an annual data report.

Sea level trends are derived from the record, however readers are cautioned against drawing any conclusions from short duration records, particularly when used in isolation from other phenomena. The sea level record includes natural variability, such as El Niño events and the effects of atmospheric, oceanographic and geological processes. Vertical movement of the instrumentation relative to local topography is monitored and the results are listed on the Geoscience Australia web site. Movement of each station relative to the International Terrestrial Reference Frame is not monitored. It is important to note that as the sea level record becomes longer, the short-term trend estimate becomes more stable and reliable.

NOTES ON THE DATA FOR SEPTEMBER 2006

Sea level data return (Figures 1 and 17) in September was good for most stations. Noisy sea level data at Burnie from the 22nd to the 25th have been removed.

The residuals (Figures 2 and 3), the difference between the observations and the tidal predictions, are the non-tidal components of the sea level observations. The residuals are primarily the consequence of short-term meteorological effects (Figures 5 and 9) and can also indicate the passage of a tsunami. Wind speed and wind gust data from Stony Point were intermittently erroneous during September. These values and the corresponding incident wind directions have been removed (Figures 4, 5 and 6).

Figure 10 compares the mean, maximum and minimum values for air temperature, water temperature and barometric pressure for September 2006 with the long-term September

values. Note that the long-term ranges are calculated using the previous sets of September data for each station **excluding** the current month of data.

The air temperatures in September 2006 were generally within the long-term September temperature ranges. The maximum temperatures at Hillarys (27.4°C), Esperance (31.2°C) and Port Kembla (30.3°C) were above the previous record maxima and the minimum air temperature at Cape Ferguson (14.6°C) was below the previous record minima. The water temperatures in September 2006 were generally within the long-term September water temperature ranges, with the exception of Hillarys, where a record maximum of 19.9°C was set and Rosslyn Bay (19.3°C) and Cape Ferguson (20.1°C) where record minima were set. Record maximum barometric pressures in September 2006 were set at Port Stanvac (1035.7 hPa), Portland (1038.6 hPa), Burnie (1039.6 hPa), Spring Bay (1038.9 hPa), Rosslyn Bay (1027.7 hPa) and Cape Ferguson (1023.6 hPa).

Figure 11 shows the monthly mean sea levels with respect to an arbitrary fixed offset from the zero of the tide gauge. The monthly mean sea levels contain seasonal variations, in contrast to the sea level anomalies (Figure 12), which has the seasonal signal removed from the data.

The sea level anomalies (Figure 12) were 5-10cm below normal at most sites in September with the exception of the South West and North East coasts where near-normal sea levels were observed.

Figure 13 shows the history of the short-term sea level trend for each site during the life of the Australian Baseline Sea Level Monitoring Project. Table 1 lists the commencement of operation, the latest sea level trend, and the change in trend with respect to the previous month's analysis. The sea level trends generally decreased in September over the previous months trends and reflects the negative sea level anomalies.

The barometric pressure anomalies (Figure 14) were positive at all sites in September particularly around Southern Australia. The occurrence of lower than normal sea levels and higher than normal barometric pressures in this region is due to the inverse barometer effect.

It is difficult to relate the water and air temperature anomalies (Figures 15 and 16) directly to those of barometric pressure and sea level without considering other effects, such as localised currents, wind speeds and directions. The anomalies are primarily used to quality check the water and air temperature data.

The number of hits to the Australian Baseline Sea Level Monitoring project web pages from 2003 to September 2006 is given in Figure A.

Please note: Tide gauges at Stony Point and Lorne do not record air temperature, water temperature and barometric pressure data and are not present in Figures 3,7,8,9,11,12,13 and 16. The tide gauge at Lorne does not record wind data and is not present in Figures 4, 5 and 6.

Table 1: Tide gauge position, installation date, short-term sea level trends and change in trend from the previous month for the Australian Baseline array through September 2006.

Location	Lat / Long	Installation Date	Trend (mm/yr)	Change from previous month
Cocos Islands	12°07'00"S / 96°53'31"E	Sep 1992	+10.4	0.0
Groote Eylandt	13°51'36"S / 136°24'57"E	Sep 1993	+7.2	-0.2
Darwin	12°28'19"S / 130°50'45"E	May 1990	+7.5	-0.2
Broome	18°00'03"S / 122°13'06"E	Nov 1991	+9.2	-0.1
Hillarys	31°49'32"S / 115°44'19"E	Nov 1991	+7.6	0.0
Esperance	33°52'24"S / 121°53'42"E	Mar 1992	+4.8	0.0
Thevenard	32°09'02"S / 133°38'25"E	Mar 1992	+3.7	-0.2
Port Stanvac	35°06'35"S / 138°27'55"E	Jun 1992	+5.0	-0.2
Portland	38°20'38"S / 141°36'49"E	Jul 1991	+2.6	-0.1
Lorne	38°30'00"S / 143°59'00"E	Jan 1993	+2.0	-0.1
Stony Point	38°22'00"S / 145°13'00"E	Jan 1993	+1.6	-0.1
Burnie	41°03'00"S / 145°54'53"E	Sep 1992	+2.3	-0.1
Spring Bay	42°32'47"S / 147°55'51"E	May 1991	+3.3	-0.1
Port Kembla	34°28'26"S / 150°54'43"E	Jul 1991	+3.9	-0.1
Roslyn Bay	23°09'40"S / 150°47'24"E	Jun 1992	+2.1	0.0
Cape Ferguson	19°16'39"S / 147°03'31"E	Sep 1991	+2.7	0.0
