The Australian Baseline Sea Level Monitoring Project

Monthly Data Report

MARCH 2012

INTRODUCTION

The mission of the Australian Baseline Sea Level Monitoring Project (ABSLMP) is to monitor changes in sea level around Australia. It involves the operation and maintenance of an array of high-resolution sea level gauges and associated meteorological instruments (see Figure B) and management of a quality-controlled national database of observations that is made available to the scientific and wider communities.

This report is one of a series of monthly data reports that provide tables and figures summarising the data collected to date. The accompanying text relates primarily to the quality of the data rather than its interpretation. Periodic scientific evaluation of the data in the context of climate variability and climate change is provided in an annual data report.

The trends are derived from the sea level record. However, readers are cautioned against drawing any conclusions from short duration records, particularly when used in isolation from other phenomena. The sea level record includes natural variability, such as El Niño events and the effects of atmospheric, oceanographic and geological processes. It is important to note that as the sea level record becomes longer, the short-term trend estimate becomes more stable and reliable. Vertical movement of the instrumentation relative to local topography is monitored and the results are listed on the Geoscience Australia web site.

NOTES ON THE DATA FOR MARCH 2012

Sea level data return (Figures 1 and 17) was good for most operative stations during March 2012. Please note that no data exists for Port Stanvac since November 2010 as the station was removed to allow the former owners of the site (Mobil Refining Australia) to rehabilitate and vacate the Port Stanvac oil refinery precinct. Re-establishment of the gauge depends on the long-term future of the wharf. The Broome Port Authority's policy of switching off the power when fuel ships are in dock resulted in the loss of 26 hours of Broome sea level and ancillary data during March. Calibration and maintenance visits were undertaken at Port Kembla, Rosslyn Bay and Cape Ferguson during March. Erroneous wind data continues to be recorded at Esperance and Groote Eylandt whilst wind monitoring at Cape Ferguson has been restored following the maintenance visit in March. No water temperatures have been recorded at Darwin since the water temperature sensor failed in January 2011.

The residuals (Figures 2 and 3), being the difference between the observations and the tidal predictions, are the non-tidal components of the sea level. They are primarily the consequence of short-term meteorological effects shown in Figures 5 and 9, and can also indicate the passage of a tsunami. The meteorological convention is followed in Figure 5 where the vector indicates the direction from which the wind is blowing.

Figure 10 compares the mean, maximum and minimum values for air temperature, water temperature and barometric pressure for March 2012 with the long-term values. Note that the long-term ranges are calculated using the previous sets of March data for each station **excluding** the current month of data.

The minimum water temperature of 27.9°C at Groote Eylandt is the lowest March reading on record, while a record minimum March barometric pressure was also recorded at Cocos Islands (998.9 hPa).

Figure 11 shows the monthly mean sea levels with respect to an arbitrary fixed offset from the zero of the tide gauge. The monthly mean sea levels contain seasonal variations, in contrast to the sea level anomalies (Figure 12), which have the seasonal signals and trends removed from the data.

Positive sea level anomalies above +5 cm were observed at Groote Eylandt (+8cm), Darwin (+9cm), Broome (+7cm), Hillarys (+12cm), Esperance (+12cm), Thevenard (+12cm), Portland (+9cm), Lorne (+7cm), Stony Point (+6cm) and Burnie (+7cm). A negative sea level of -8cm was observed at Cocos Islands whilst the sea level anomalies were close to normal at Spring Bay, Port Kembla, Rosslyn Bay and Cape Ferguson.

Figure 13 shows the history of the short-term sea level trend for each site during the life of the Australian Baseline Sea Level Monitoring Project. Table 1 lists the commencement of operation, the latest sea level trend and the change in trend with respect to the previous month's analysis. It is important to stress that as the sea level record becomes longer, the short-term trend estimate becomes more stable and reliable. Observed trends in sea level include natural variability, for example, events such as El Niño and effects due to many other atmospheric, oceanographic and geological processes. Longer-term data sets for all stations are required in order to separate the effects of the different signals. ***Please exercise caution in interpreting the short-term trends in the table below*** – they will almost certainly change over the coming years as the data set increases in length.

Negative barometric pressure anomalies (Figure 14) lower than -2.0 hPa were observed at Cocos Islands (-2.0 hPa), Portland (-2.2 hPa), Rosslyn Bay (-2.3 hPa) and Cape Ferguson (-2.2 hPa) during March whilst anomalies were near zero for all other locations. It is difficult to relate the water and air temperature anomalies (Figures 15 and 16) directly to those of barometric pressure and sea level without considering other effects, such as localised currents, wind speeds and directions. The anomalies are primarily used to quality check the water and air temperature data. During March 2012 positive water temperature anomalies greater than +0.5°C were observed at Cocos Islands (+0.6°C), Esperance (+0.8°C) and Burnie (+0.6°C) whilst water temperature anomalies lower than -0.5°C were observed at Groote Eylandt (-0.6°C), Broome (-1.2°C) and Port Kembla (-1.3°C). A positive air temperature anomaly of +0.8°C was observed at Hillarys whilst negative anomalies lower than -0.5°C were observed at Broome (-1.4°C) and Port Kembla (-0.6°C) for March 2012.

The number of hits to the Australian Baseline Sea Level Monitoring Project (ABSLMP) web pages from January 2009 to March 2012 are given in Figure A.

Please note: Tide gauges at Stony Point and Lorne do not record air temperature, water temperature and barometric pressure data and are not present in Figures 3,7,8,9,11,12,13 and 16. The tide gauge at Lorne does not record wind data and is not present in Figures 4, 5 and 6.

Table 1: Tide gauge position, data start date, short-term sea level trends and change in trend from the previous month for the Australian Baseline array through March 2012.

Recent short-term sea level trends in the project area based upon SEAFRAME data through March, 2012				
Location	Lat / Long	Installation Date	Trend (mm/yr)	Change from previous month
Cocos Islands	12°07'07.1"S / 96°53'30.9"E	Sep 1992	+8.4	-0.1
Groote Eylandt	13°51'36.2"S / 136°24'56.1"E	Sep 1993	+9.3	+0.1
Darwin	12°28'18.4"S / 130°50'45.1"E	May 1990	+8.9	+0.1
Broome	18°00'03.0"S / 122°13'07.1"E	Nov 1991	+9.3	+0.1
Hillarys	31°49'32.0"S / 115°44'18.9"E	Nov 1991	+10.0	+0.2
Esperance	33°52'15.2"S / 121°53'43.3"E	Mar 1992	+6.5	+0.2
Thevenard	32°08'56.2"S / 133°38'28.8"E	Mar 1992	+5.1	+0.2
Port Stanvac	35°06'31.0"S / 138°28'1.3"E	Jun 1992	+4.7	0.0
Portland	38°20'36.4"S / 141°36'47.4"E	Jul 1991	+3.5	+0.1
Lorne	38°32'49.4"S / 143°59'19.8"E	Jan 1993	+2.9	+0.1
Stony Point	38°22'19.7"S / 145°13'28.9"E	Jan 1993	+2.8	+0.1
Burnie	41°03'0.3"S / 145°54'54.0"E	Sep 1992	+3.3	+0.1
Spring Bay	42°32'45.1"S / 147°55'57.8"E	May 1991	+3.5	0.0
Port Kembla	34°28'25.5"S / 150°54'42.7"E	Jul 1991	+3.1	0.0
Rosslyn Bay	23°09'39.7"S / 150°47'24.6"E	Jun 1992	+3.8	0.0
Cape Ferguson	19°16'38.4"S / 147°03'30.4"E	Sep 1991	+4.7	0.0
